HYBRID NANOPARTICLES WITH Ln_2O_3 CORE AND CARRYING BIOLOGICAL LIGANDS, AND METHOD OF PREPARATION THEREOF

ABSTRACT

- 5 The invention concerns hybrid nanoparticles containing:
- a nanosphere, of mean diameter included in the range from 2 to 9 nm, of which at least 90 % by weight consists of Ln_2O_3 where Ln represents a rare earth, optionally doped with a rare earth or an actinide, or a mixture of rare earths, or a rare earth and actinide mixture, in which at least 50 % of the metal ions are rare
 - 10 earth ions,
 - a coating around the nanosphere chiefly consisting of functionalized polysiloxane, having a mean thickness included in the range from 0.5 to 10 nm, preferably greater than 2 nm and no more than 10 nm, and
 - at least one biological ligand grafted by covalent bonding to the polysiloxane
 - 15 coating
- and their method of preparation.
